

Week 7 Report

In this week,

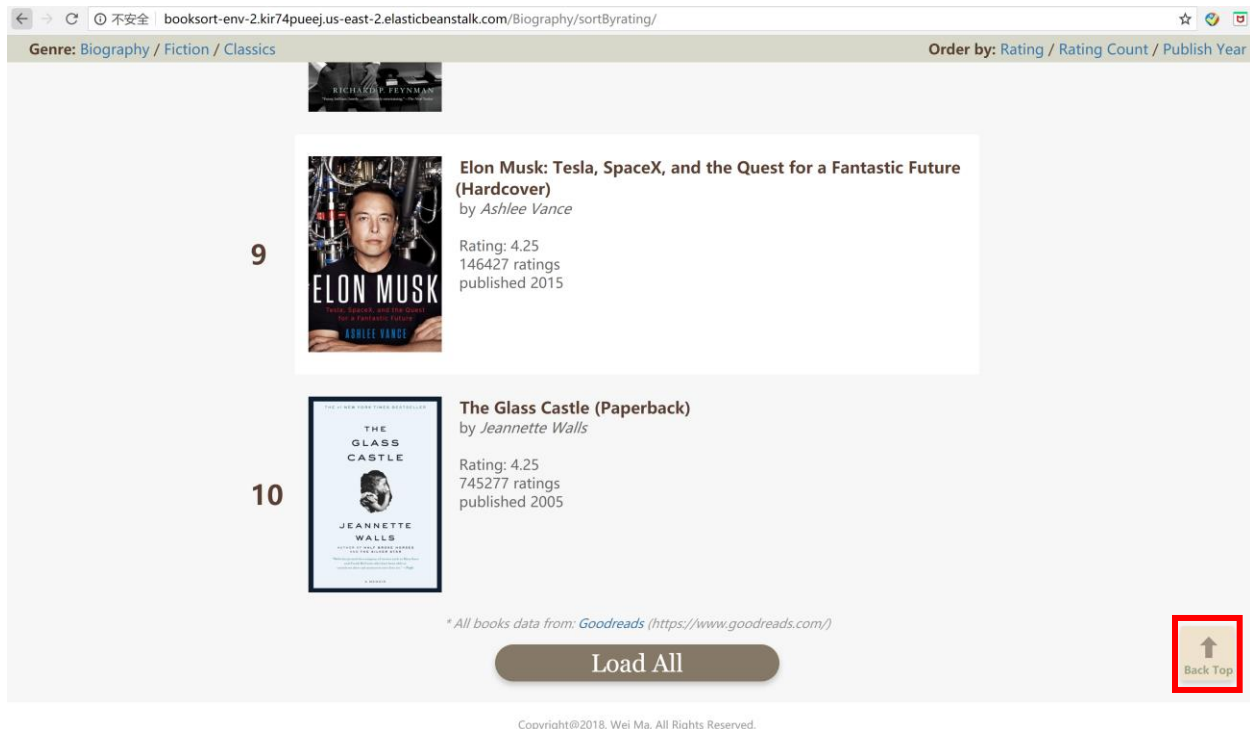

1. I collected books of another two genres: fiction and classics, from the *Goodreads* (<https://www.goodreads.com/>). There are 31 books in fiction and 27 books in classics.
2. I added the options of fiction and classics to the part of genre, shown as below:

And I achieved that when user choose one of these three genres, it will show the books belong to this genre and it shows them in the order of rating as default. Users can continue to choose which order of books they want to see.

As I did in last week, users can see all books in the genre they choose by click the button of “Load All”.

3. I added a button of “Back Top”. It will show automatically in the bottom right corner when user scroll down. Shows as below:

When clicked the button of “Back Top”, it will immediately go back to the top of this page. And after go back to the top, the button of “Back Top” automatically disappear.

Problem:

1. Fail to go back to the top using the back top button.

Solution: using the JavaScript examples to learn how to call the function to achieve that.

https://www.w3schools.com/js/js_examples.asp

In the next week, I will:

1. Optimize the index page that it will shows covers of books by scrolling display.
2. Optimize the way of showing the details of books. For example, there are 5 stars in color represented the maximum score of book rating. And it will show stars in color and corresponding with the rating of each book.
