# Week 11 Report

In this week,

1. I used CSS to set the length of description to display in a certain number of rows so that it would not be too long to read. Shown as below:

If user want to read more, just click the image of book cover and go to the detail page of book.

2. I add "target="_blank"" in the a tag and it will create a new tag page rather than use the current tag page to show the detail of book when user click the link in the book list.

There is no need for users to go back and they can see the previous page directly.

Problem:

1. Don't know where to set how to open the link.

   Solution: search and read on the Internet.

In the next week, I will:

Prepare the presentation of my project in the next Tuesday.
